

## Pong Game

We will start by downloading a template from the ReachOut Kids Page

After downloading, go to MIT Scratch

Click File, select Load from your computer, click download and double click on Pong.sb3

Now you should have Space Background, downBar, and upBar

Let learn about coordinates – every game that we will use coordinates

Click on the Basketball

Change the x and y coordinates to 0 (0 and 0 is the center of the screen)

**X is horizontal**, and **Y is vertical**

How do I move the basketball to the right or to the left?

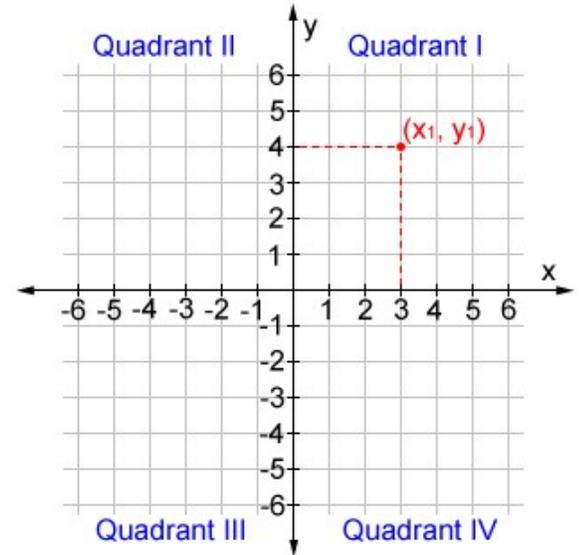

How do I move the basketball to the up or down?

Change the x and y coordinates to 0

Motion section

Change x by 10 (click on it), change to -10 and click on it

Change y by 10 (click on it), change to -10 and click on it

Knowing this is important because we will be moving our sprit (characters) in many directions

Click the platform and let get started

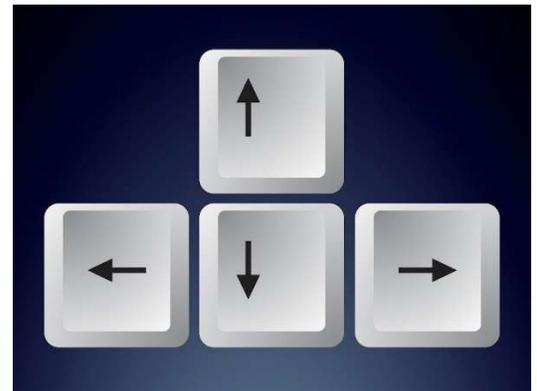

### Let start coding

Click on the downBar

### Event section

When Flag clicked

We will now connect the left and right arrow keys so that we can move left to right

### Control Section

If then block

### Sensing Section

Key space pressed? (change space to right arrow)

So if the right arrow is press I want to change the x coordinate

### Motion Section

Change x by 10 block

Right now when we run the script nothing will happen, why?

Because, by the time run to the time I click on the arrow key, the script is all ready done.

So we need it to run all the time. What do we need to do that?

We need to constantly check to see if the right arrow is pressed

We can do that by using a forever block.

## Control Section

Forever block

Put everything in the forever block (except when clicked)

Now lets run the script

Click and the green flag and press on your right arrow key

Now lets duplicate it for the left arrow key

Right click on the if then block and select duplicate

Move it just below, and change the right arrow to left arrow

Now let do the same for the upBar sprit

We are simply going to take the code we have for the downBar and drag it to the upBar sprite

This is a simple way do duplicate the code

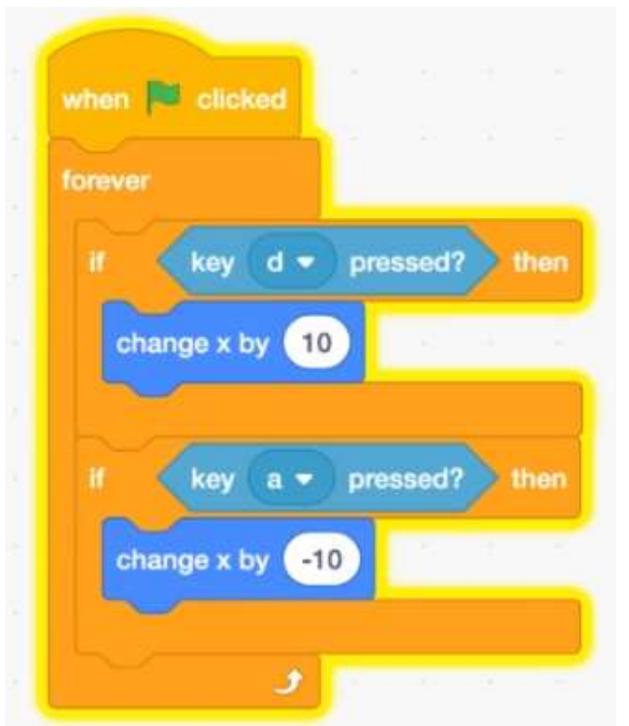

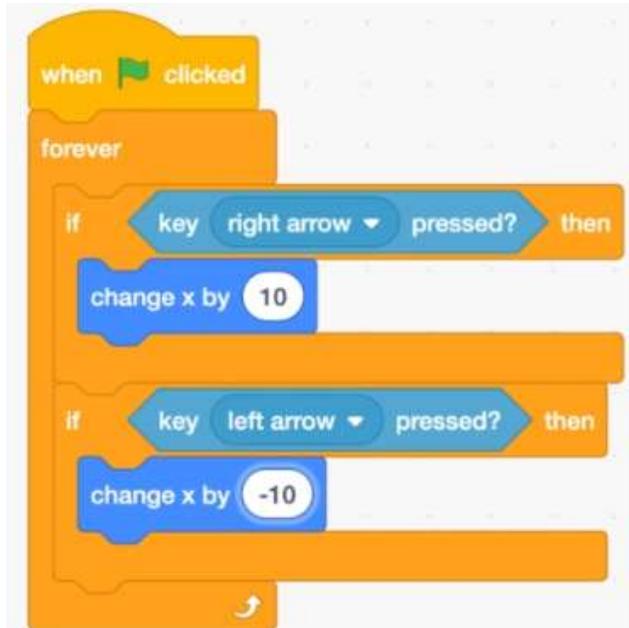

For the upBar

Change the right arrow → d

Change the left arrow → a

Now we have complete two play control for the game.

Next, script for the ball

Script for the Ball

We will learn about directions and degrees

Select the basketball sprite

### Event Section

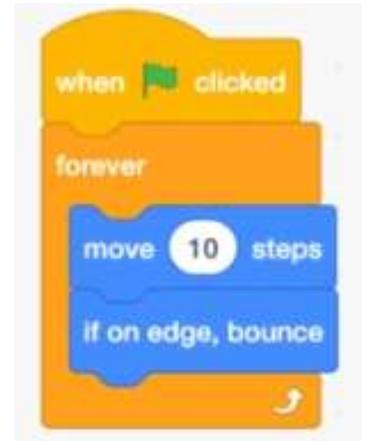

When flag clicked

Forever block

### Motions Section

Move 10 steps block

If on edge, bounce

We need to start the game with the ball in the center

### Motion Section

Add right below when clicked

Go to x:0 y:0

Point in direction 90

We need to make it so the ball goes in all directions

We need it to be done randomly

### Operators Section

Pick random 1 to 10 (place inside the point in direction 90)

Change 1 to 10 → 1 to 360

Let run the script

Let's fix it so that the ball is not going through the platform

On the side of the code:

### Control Section

If then block

### Sensing Section

Touching mouse-pointer block

(change mouse pointer to downBar)

### Motion section

Turn 15 degrees (change 180)

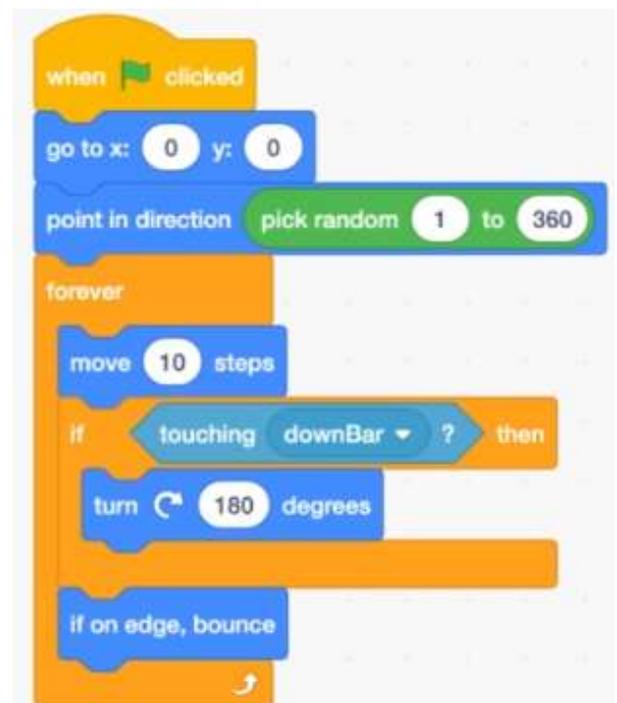

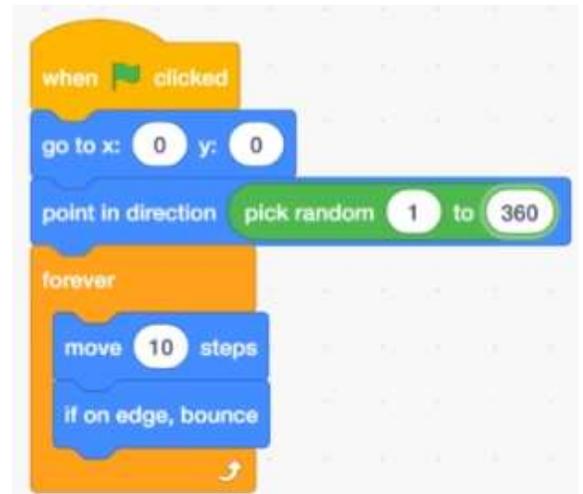

Now move the if then block to inside the forever loop

Between the two blocks

Let run the script

We will see that the ball will now bounce off the downBar

Turning 180 degrees

Lets do the same for the upBar

On the side of the code:

### Control Section

If then block

### Sensing Section

Touching mouse-pointer block  
(change mouse pointer to upBar)

### Motion section

Turn 15 degrees (change 180)

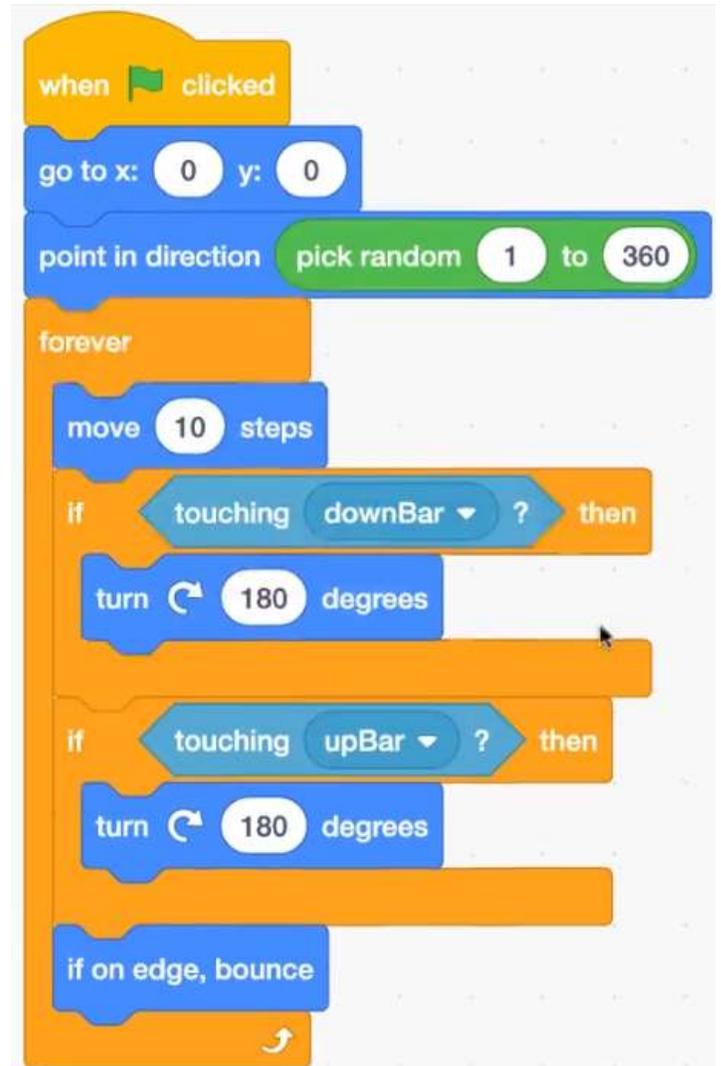

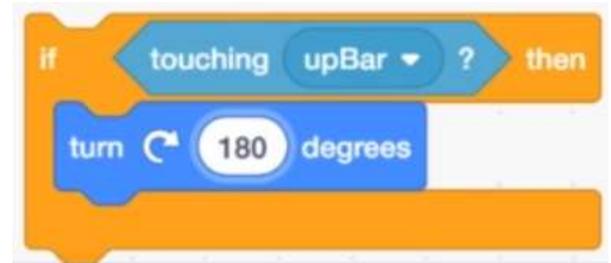

Now move the if then block below the other if then block

Let run the script

You may notice that the ball is not moving right, and it can get stuck in a forever direction, and it will not be fun playing it

We need a smarter way for the ball to bounce off the two platforms (downBar and upBar)

So left fix it.

Lets do a proper bouncing

Lets move the turn 180 degrees to an open space  
And lets replace it but point in direction block

**Motion Section**

Point in direction 90

**Operators Section**

Rounded difference operator  
(Put inside the point in direction 90)  
Enter 180 for the first hole  
For the second one we will add the direction

**Motion Section**

Direction block (rounded)

We will do the same for the next if then blow  
Remove the turn 180 degrees

**Motion Section**

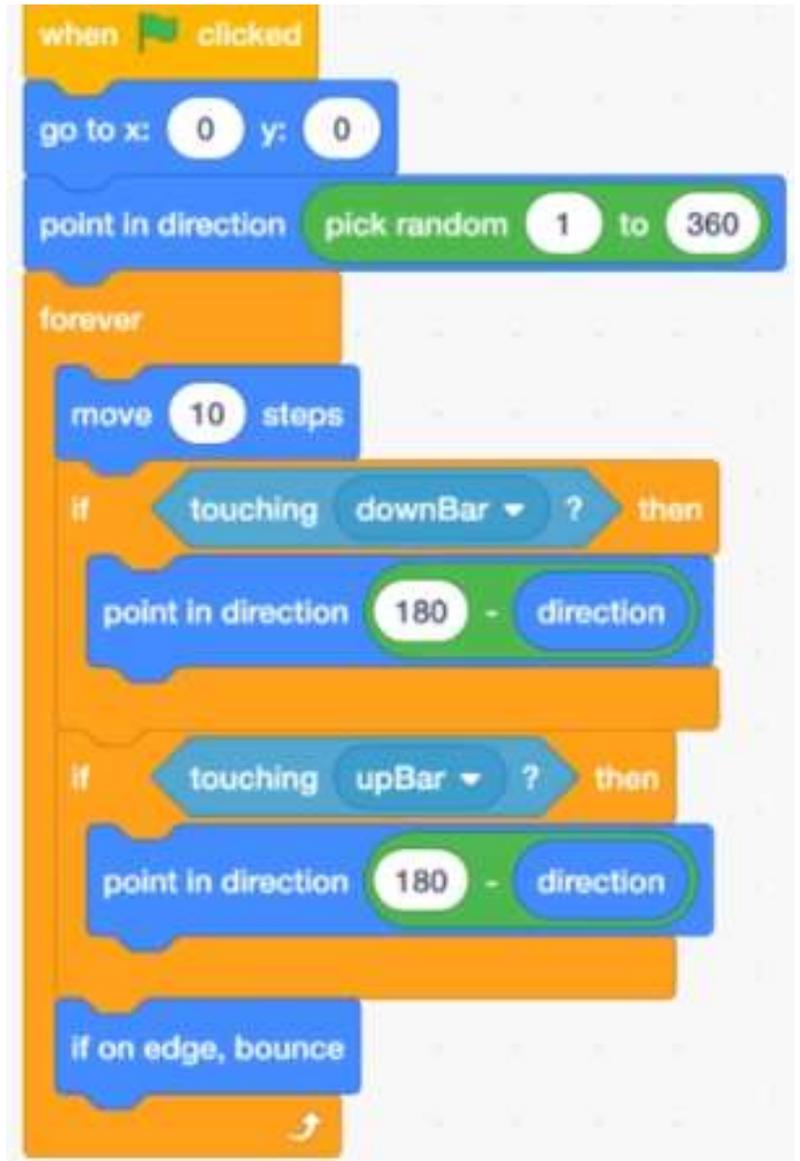

Point in direction 90

**Operators Section**

Rounded difference operator  
(Put inside the point in direction 90)  
Enter 180 for the first hole  
For the second one we will add the direction

**Motion Section**

Direction block (rounded)

Next we need to keep track of who is winning when the game is played

So when need to reset the game when someone score  
Let add that code

On the side of the code add:

### Control Section

If then block

In the diamond shape add

### Operators Section

Greater than > 50 (change to 140)

### Motion Section

Y position (place in the first hole)

### Motion Section

Add right below when clicked

Go to x:0 y:0

Point in direction 90

### Operators Section

Pick random 1 to 10 (place inside the point in direction 90)

Change 1 to 10 → 1 to 360

We will now duplicate it for the bottom part

Remove the diamond shape

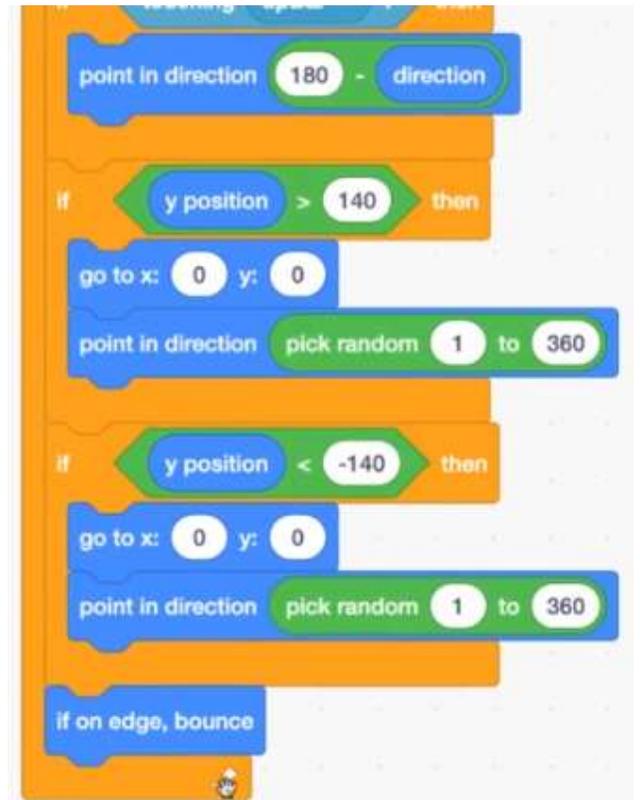

### Operator Section

Less than < 50 (change to -140)

### Motion Section

Y position (place in the first hole)

Now we going to move this block right before if on edge bounce  
block in the forever loop

```
go to x: 0 y: 0
point in direction pick random 1 to 360
forever
  move 10 steps
  if touching downBar ? then
    point in direction 180 - direction
  if touching upBar ? then
    point in direction 180 - direction
  if y position > 140 then
    go to x: 0 y: 0
    point in direction pick random 1 to 360
  if y position < -140 then
    go to x: 0 y: 0
    point in direction pick random 1 to 360
  if on edge, bounce
```

The image shows a Scratch script for a bouncing ball simulation. It starts with a 'go to x: 0 y: 0' block, followed by a 'point in direction pick random 1 to 360' block. A 'forever' loop contains several blocks: 'move 10 steps', an 'if touching downBar ? then' block with 'point in direction 180 - direction', an 'if touching upBar ? then' block with 'point in direction 180 - direction', an 'if y position > 140 then' block with 'go to x: 0 y: 0' and 'point in direction pick random 1 to 360', an 'if y position < -140 then' block with 'go to x: 0 y: 0' and 'point in direction pick random 1 to 360', and finally an 'if on edge, bounce' block.

Now lets learn about Variables

### Variables Section

Make a Variable (name it Red score)

Check for all sprites

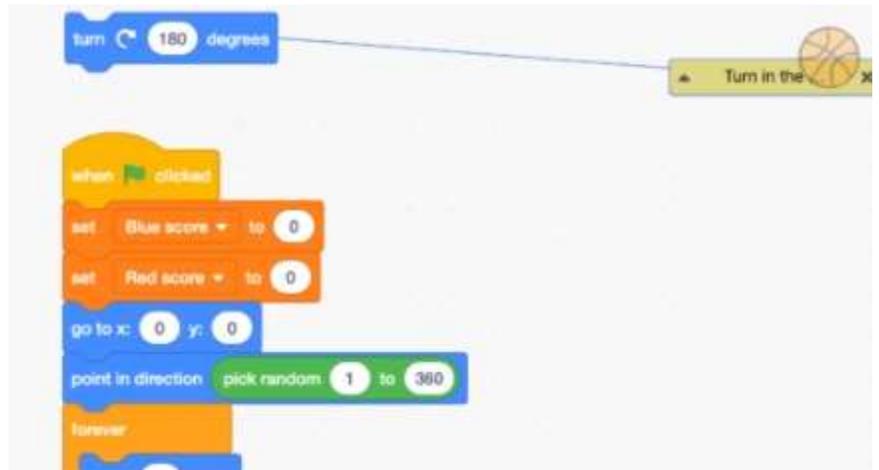

Make another one and name it Blue score

Add to the platform

Set Blue score to 0

Duplicate it and change to Red score

Now move both below when flag clicked

Add the change Blue score by 1 (change to Red score)

Put it in the if y position > 140

Add the change Blue score by

Put it in the if y position < -140

For good visual, let move the scores to their right place

## Adding final touches

Have the ball wait some seconds when a player score before moving in a random direction

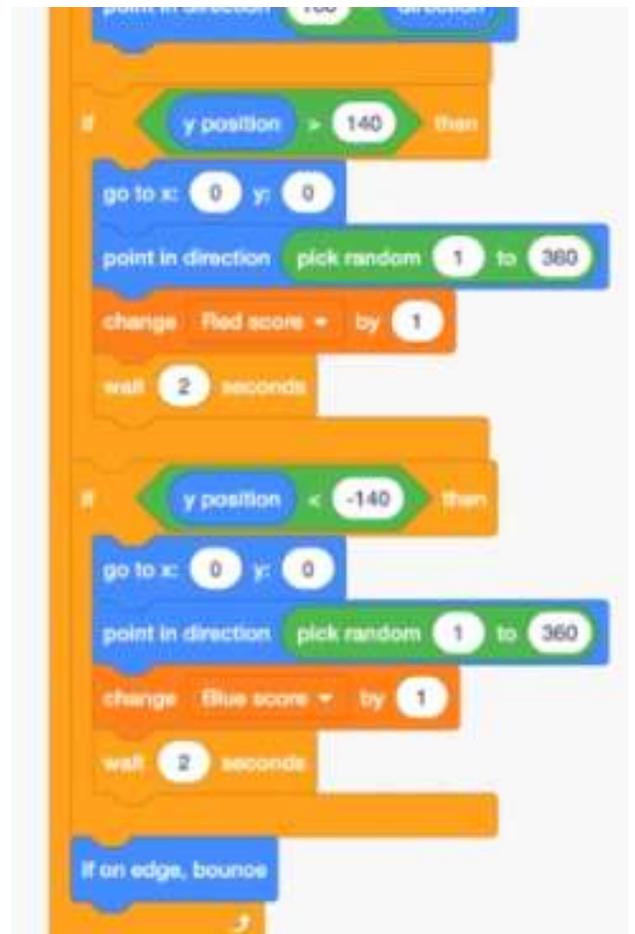

### Control Section

Wait 1 seconds (change to 2)

Put it right before the forever loop

Let do the same in the if condition with the y positions

Place the wait 1 second (change to 2) after the change score by 1

Adding speed – making challenging

### Variable Section

Make a Variable (name it speed, and select For this sprite only)

Add

Set Blow score to 0 (change to speed and set to 10)

Place it under the set scores under when flag clicked

In the forever block

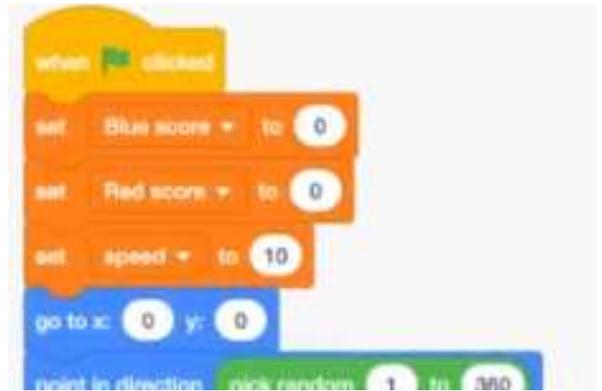

Inside the move 10 steps, insert speed

Add

Change Blue score by 1 (change to speed)

Do the same for the other if condition

This means if the ball touches the upBar or downBar the speed will be increased by 1

Let hide the ball speed on the screen

Add hide variable Blue score (change to speed)

Place under the set speed to 10 on the top

We also need to reset the speed after a player score

Add

Set Blue score to 0 (change to speed and set to 10)

Place in the if statement if y position > 140 and again for y position < -140

Well done. That is the End.
